APPLICATION (CC, No, Date): EP 96307481 961015;

PRIORITY (CC, No, Date): US 544243 951017

DESIGNATED STATES: DE; FR; GB; NL; SE

INTERNATIONAL PATENT CLASS: H04R-029/00

ABSTRACT EP 769888 A2

A system and method for testing communication devices, such as speakerphones, are disclosed. In one embodiment, a two-way conversation is pre-recorded for playback through one or more test communications devices (130, 140) to evaluate communications device performance. The test set-up permits the recording of a two-way full-duplex communication onto two or more channels of the same recording/playback device, (90), thereby preserving the content and timing relationships between speech segments. A comparison can be made between the live conversation and the conversatoin as it was realized in the playback condition over a test communications device. The original and the test will be different based on the performance of the communications device. This method decreases the test time and provides other efficienciess useful in connection with testing, evaluation and quality control for communications device acoustic and network performance testing.

English Abstract

A vehicular video mirror system includes an interior rearview mirror assembly and a video display assembly. The interior rearview mirror assembly includes a mirror casing incorporating a reflective element. The mirror casing is adjustable about the mirror-mounting portion for adjusting the rearward field of view of the reflective element. The video display assembly includes a video screen which is incorporated in a video display housing. The display housing is adapted to be adjustable about the display-mounting portion for adjusting the orientation of the video screen and, further, for moving the display housing to a stowed position whereby the video screen is generally not viewable by a driver when seated in a vehicle seat in the vehicle to thereby minimize the distraction to the driver of the vehicle.

April 3, 2003

French Abstract

La presente invention concerne un systeme de miroir video comportant un ensemble retroviseur interieur et un ensemble afficheur video. L'ensemble retroviseur interieur comprend un carénage de miroir pourvu d'un element reflechissant. L'ensemble miroir est pourvu en outre d'une potence de montage de miroir. Le carénage de miroir est réglable autour de la potence de montage de miroir de facon a regler le champ d'observation du retroviseur. L'ensemble afficheur video comporte un ecran video integre a un carter d'afficheur video. Ce carter d'afficheur video est concu pour se regler autour de la potence de montage d'afficheur de facon a regler l'orientation de l'ecran video, et d'autre part pour deplacer le carter d'afficheur en une position de blocage selon laquelle l'ecran video n'est generalement pas observable du chauffeur lorsqu'il est assis dans un siege du vehicule de facon a minimiser la distraction du chauffeur du vehicule.

English Abstract

A vehicular tire inflation monitoring system is provided for a vehicle that includes at least one tire inflation indicator assembly (16), visible exterior of the vehicle, positioned at an exterior vehicle portion, such as at an exterior rearview mirror assembly (14). The at least one tire inflation indicator assembly provides an indication of the inflation condition of at least one of the vehicle tires. The tire inflation monitoring system includes a control receiving at least one input from at least one tire pressure sensor sensing pressure of at least one vehicle tire. The control produces an output to illuminate the at least one tire inflation indicator assembly.

French Abstract

L'invention concerne un systeme de surveillance du gonflage des pneus d'un vehicule. Ce systeme comprend au moins un ensemble indicateur de gonflement des pneus (16), visible a l'exterieur du vehicule, place dans une section exterieure du vehicule telle que dans un bloc retroviseur exterieur (14). Cet/ces ensemble(s) indicateur du gonflement des pneus fournissent une indication concernant l'etat de gonflement d'au moins un des pneus du vehicule. Ce systeme de surveillance du gonflage comprend une commande qui recoit au moins une entree en provenance d'au moins un capteur de pression du pneu qui detecte la pression d'au moins un pneu du vehicule. Cette commande produit une sortie qui active une indication lumineuse dans l'ensemble indicateur du gonflement des pneus.

English Abstract

An Intelligent scalable switching network. The present invention provides a unified internet portal server (UIP Server) having multi-line capability, and a unified internet portal client (UIP Client) incorporating functionality of a Customer Premise Equipment (CPE) DSL Modem (346), wherein the UIP Client (224) is capable of communicating with the UIP Server (226) via a network to provide a service to a subscriber using the UIP Client (224). The UIP server (226) comprises a single server chassis incorporating all of a plurality of processing elements. The UIP Server (226) is located remote from a subscriber location (SL) and capable of providing a plurality of services using a digital subscriber line (DSL). The UIP client (224) is located at the SL and is capable of deploying DSL capability on a single communication line.

French Abstract

L'invention concerne un reseau intelligent commute evolutif. La presente invention concerne un serveur d'accès Internet unifie a capacite multiligne et un accès Internet unifie client a fonctionnalite de modem DSL (ligne d'abonne numerique) d'equipement prive d'abonne (EPA) (346). L'accès Internet unifie client (224) est capable de communiquer avec le serveur d'accès Internet unifie (226) via un reseau de facon a fournir un service a un abonne utilisant l'accès Internet unifie client (224). Selon l'invention, le serveur d'accès Internet unifie (226) comprend un simple boîtier de serveur a plusieurs elements de traitement. De plus, le serveur d'accès Internet unifie (226), situe a distance d'un emplacement d'abonne, est capable d'offrir une pluralite de services via une ligne d'abonne numerique. L'accès Internet unifie client (224), situe a l'emplacement d'abonne, est capable de deployer une capacite de ligne d'abonne numerique sur une seule ligne de communication.

English Abstract

A device (1) for receiving streaming audio or other audio sources (26) netcast in analogous fashion to a radio broadcast, said device providing an interface analogous to a radio receiver, eliminating the necessity of an intervening personal computer system.

French Abstract

L'invention concerne un dispositif (1) permettant de recevoir un contenu audio ou d'autres sources (26) audio diffuse sur le reseau de facon semblable a ce qu'il se fait pour la radiodiffusion. Ledit dispositif constitue une interface analogue a un recepteur radio, ce qui permet de se dispenser d'un micro-ordinateur personnel.

English Abstract

A dynamically configurable network has data stations (3-11) and wireless protocol stations (2). A wireless protocol station and at least one data station form a local area network. Separate local area networks are connected to each other through wireless protocol stations. The wireless protocol stations and the data stations have a physical layer protocol (80-87) that sits in a physical layer, whereby the wireless protocol station has all physical layer protocols of data stations to which it currently connected to, so as to dynamically support various media. The wireless protocol stations and the data stations further have service application layer protocols that sit in service layers (110-117), and a service access point protocol in between the service layer and the physical layer. A service application layer of a data station provides a data service. Data between data stations or between a data station and a wireless protocol station are physically exchanged via a communication link using the physical layer protocol. The data service is accessed through the service access point protocol.

French Abstract

L'invention porte sur un reseau configurable dynamiquement qui possede des stations de donnees et des stations de protocole radio. Une station de protocole radio et au moins une station de donnees forment un reseau local. Les reseaux locaux separees sont raccordes les uns aux autres par des stations de protocole radio. Les stations de protocole radio et les stations de donnees ont un protocole qui est installe dans une couche physique, la station de protocole radio possedant tous les protocoles de couche physique des stations de donnees auxquels elle est generalement connectee de facon a supporter dynamiquement divers supports. Les stations de protocole radio et les stations de donnees ont egalement des protocoles de couche d'application de service qui sont installes dans les couches de service, et un protocole de point d'accès au service est installe entre la couche de service et la couche physique. Une couche

April 3, 2003

d'application de service d'une station de donnees forme un service de donnees. Les donnees entre les stations de donnees ou entre une station de donnees et une station de protocole radio sont echangees physiquement par une ligne de communication au moyen du protocole de couche physique. Le service de donnees est accessible par le protocole de point d'accès au service.

English Abstract

A multimedia network for enabling the viewing of computer-generated data (12) on any television, video and/or audio display (TV) connected to a multimedia network, such as a hard wired coaxial television cable network. The multimedia network enables the remote control (18) of a computer via control signals carried over the multimedia network, as well as the remote control of a video device via control signals generated by

April 3, 2003

a computer and carried over the multimedia network, thus enabling the viewing of computer-generated data (12) on any television, video and/or audio display connected to a multimedia network. A method for indicating the content recorded on a video recording medium. An HTML-type document is created by a computer or microprocessor and recorded on the recording medium. An inventive wireless display terminal receives a video signal originating from a computer, multimedia or other audio and/or video signal generating device and transmitted via RF signals from an antenna node.

French Abstract

L'invention concerne un reseau multimedia qui permet de visualiser des donnees informatiques sur un ecran de television, video et/ou sur un systeme d'affichage audio relie a un reseau multimedia, du type reseau de television par cable coaxial. Le reseau multimedia permet d'assurer la commande a distance d'un ordinateur via des signaux de commande achemines sur le reseau multimedia, et la commande a distance d'un dispositif video via des signaux de commande informatiques achemines sur le reseau multimedia, ce qui permet de visualiser les donnees informatiques sur un ecran de television, video et/ou sur un systeme d'affichage audio relie a un reseau multimedia. L'invention concerne en outre un procede permettant d'indiquer le contenu enregistre sur un support d'enregistrement video. Un document de type HTML est cree par ordinateur ou microprocesseur et enregistre sur le support d'enregistrement. Ce document contient des informations relatives au contenu enregistre sur le support d'enregistrement. Un terminal d'affichage sans fil recoit un signal video emanant d'un ordinateur, d'un dispositif multimedia ou autre dispositif generateur de signaux audio et/ou video, et transmis via des signaux RF depuis un noeud d'antenne. On peut ainsi etablir en tout point au bureau ou a domicile une zone de signaux hertziens controlable, de haute securite, a faible niveau d'emission, claire et coherente. Des dispositifs de noeud d'antenne permettent d'assurer les liaisons avec des reseaux existants et constituent une passerelle entre les dispositifs sans fil et le reseau cable. L'utilisation de reseaux en cable existants permet d'assurer un trajet de transmission efficace pour les besoins de la connectivite entre les dispositifs de noeud d'antenne et les dispositifs relies au reseau coaxial. L'utilisation des elements du reseau hertzien permet d'assurer la mobilite et d'eviter les difficultes liees a l'installation de nouveaux cables.

Fulltext Word Count: 1535

English Abstract

A subscriber system (10) includes a dual network interface module (12). The dual network interface module (12) includes slots for a video unit (20) and a bandwidth unit (22). The video unit (20) receives broadcast information from a service provider (24) for ultimate display and viewing by a subscriber at the subscriber system (10). The bandwidth unit (22) provides an interface to a telecommunications network (30) through a telecommunications element (28). The dual network interface module (12) also includes an AC carrier modem (32) that receives and sends information to a processor device (34) over existing AC power lines within the subscriber system (10). In this manner, interactive interfacing of broadcast information received at the video unit (20) can be performed at the processor device (34) through the bandwidth unit (22) and over the telecommunications network (30) on a real time basis. The use of an existing subscriber link (26) and the AC power lines within the subscriber system (10) allows for a cost effective and efficient technique for providing interactive services to subscribers connected to an existing telephone backbone.

French Abstract

Un systeme d'abonne (10) comprend un module (12) d'interface de reseau double. Ce module (12) d'interface de reseau double comprend des positions d'enfichage pour une unite video (20) et pour une unite de largeur de bande (22). L'unite video (20) recoit de l'information radiodiffusee d'un fournisseur de service (24), laquelle information est finalement affichee et visualisee par un abonne sur le systeme d'abonne (10). L'unite de largeur de bande (22) fournit une interface a un reseau (30) de telecommunications au moyen d'un element (28) de telecommunications. Le module (12) d'interface de reseau double comprend egalement un modem (32) pour porteuse a courant alternatif qui recoit et envoie des informations a un processeur (34) via des lignes de courant alternatif du systeme d'abonne (10). De cette maniere, l'interfacage interactif pour de l'information radiodiffusee recue sur l'unite video (20) peut etre realise en temps reel sur le processeur (34) par l'unite de largeur de bande (22) via le reseau (30) de telecommunications. L'utilisation d'une liaison (26) d'abonne existante et les lignes de courant alternatif du systeme d'abonne (10) permettent d'obtenir une technique efficace et a frais reduits pour fournir des services interactifs a des abones connectes a un reseau telephonique existant.

English Abstract

A videoconferencing network for digital computer workstations (PC2...PCX) that operate on a local area network (LAN) to exchange data. The network includes a signalling local area network (A-LAN), connected to a first port of a plurality of workstations, for transmitting and receiving data signals between selected ones of the workstations and a broadband local area network (B-LAN) connected to a second port of the plurality of workstations, for transmitting and receiving television signals between selected ones of these workstations. Each television signal is transmitted at a selected frequency channel so that no two transmissions interfere. A software program, stored in and operable on the computer of each workstation, generates and receives data messages, transmitted via the A-LAN, to and from the computer of another workstation, respectively. These data messages initiate and control the transmission of the television signals on the B-LAN such that a plurality of television signals are transmitted simultaneously on the B-LAN, with each television signal assigned to a separate frequency channel. The software program in each computer monitors the status of the channel allocations and generates the channel selecting control signals.

French Abstract

Cette invention concerne un reseau de visioconference destine a des postes de calculateurs numeriques (PC2...PCX) qui fonctionnent sur un reseau local (LAN) pour echanger des donnees. Le reseau comprend un reseau local de signalisation (A-LAN), connecte a un premier point d'acces de plusieurs postes de travail, qui envoie et recoit des signaux de donnees entre des postes de travail selectionnes et un reseau local a large bande (B-LAN) connecte a un deuxieme point d'acces des divers postes de travail qui envoie et recoit des signaux televisuels entre les postes de travail selectionnes. Chaque signal televisuel est envoye sur un canal de frequence selectionne, de sorte que deux transmissions ne peuvent interferer. Un progiciel, stocke dans l'ordinateur de chaque poste de travail et utilisable par l'ordinateur, genere et recoit des messages de donnees, transmis par le reseau local (A-LAN) de signalisation qui sont destines a l'ordinateur d'un autre poste de travail ou proviennent de ce dernier. Ces messages de donnees amorcent et commandent la transmission des signaux televisuels sur le reseau local a large bande (B-LAN), de sorte que plusieurs signaux televisuels sont transmis simultanement sur le reseau local a large bande (B-LAN), chaque signal televisuel etant affecte a un canal de frequence distinct. Le progiciel de chaque ordinateur surveille l'etat des attributions de canaux et genere les signaux de commande de selection des canaux.

English Abstract

A radio arrangement and method allows a portable (210) and a mobile (212) to uniquely communicate on a radio system having at least one remote system site (114). The portable (210) has at least one information set (such as the radio's identification information and repertory dialing information) (356 or 360), and the mobile (212) is intercoupled therewith via a connector (214). The connector is used for transferring a code, which designates the information set, from the portable (210) to the mobile (212), whereby the mobile (212) adopts the information set of the portable (210) for subsequent communication. The arrangement offers a user having a portable, with its limited features and functions, to utilize all of the capabilities of the mobile.

French Abstract

Un systeme et un procede de communication par radio permet a une radio portative (210) et a une radio mobile (212) de communiquer uniquement sur un systeme radio ayant au moins un site distant (114). La radio portative (210) possede au moins un ensemble d'informations (telles que les informations d'identification de la radio et les informations d'appel de repertoire) (356 ou 360), et la radio mobile (212) est couplee a la radio portative via un connecteur (214). Le connecteur est utilise pour transferer un code qui designe l'ensemble d'informations de la radio portative (210) a la radio mobile (212), de sorte que la radio mobile (212) adopte l'ensemble d'informations de la radio portative (210) pour des communications ulterieures. L'agencement permet a un utilisateur ayant des radios portatives avec ses caracteristiques et fonctions limitees d'utiliser toutes les possibilites de la radio mobile.

ABSTRACT EP 765067 A2

A loop gain processing scheme for a speakerphone arrangement determines system loop gain according to two echo feedback paths within the speakerphone system. Gain values for each half-loop (200 and 210) are calculated separately to ensure that both the local and far end telephone or speakerphone system are stable. A first half-loop includes gain contributions from a feedback path extending from a local speakerphone microphone (216) to a hybrid line interface (240), which **couples** the **speakerphone** to the **telephone** network line, and subsequently to a local loudspeaker (264). A second half-loop defines a feedback path from a line receive channel to a transmit channel. Gain contributions are input into a system controller (230) which determines gain values for each of the half-loops to accurately set the proper gain switching mode.

INTERNATIONAL PATENT CLASS: H04M-009/08; H04B-003/23; H04M-001/20

ABSTRACT EP 765066 A2

A cost-effective anti-howling system and method enables fast detection of the presence of true double talk, and substantially eliminates undesirable howling attributable to sudden changes in the acoustic echo path between a speakerphone microphone (110) and loudspeaker (134) during speakerphone conversations. Speakerphone embodiments include a delay-compensated and normalized cross-product calculation (218) performed by a system processor having at least two memory buffers (310, 320). One buffer is associated with the loudspeaker signal and the other buffer is associated with the microphone signal. The delay-compensated cross-product of the microphone voice signal input and the loudspeaker voice signal output is determined and normalized by energy estimates of the two signals to reduce the calculation error made by variance in the signal level.

ABSTRACT EP 664632 A2

The invention provides a single chip digital answering machine, telephone, speakerphone and analog display services interface controller circuit. The invention includes a telephone controller including control means which includes a memory interface means for controlling storage in and retrieval of data from a memory; a single digital processor for converting the electrical signals representative of an audible input to digital data and for converting digital data to electrical signals representative of an audible output; telephone line interface means for coupling the digital signal processor to the telephone line and a user interface for coupling the telephone line interface to a speaker and a microphone. The controller, the digital signal processor, the telephone line interface and the user interface are all integrated within a common integrated circuit.

IDEM;

ABSTRACT EP 366584 A2

A full-duplex digital speakerphone 10 includes a transmit signal path having an output coupled to a telephone trunk and a receive signal path having an input coupled to the telephone trunk and an output coupled to a loudspeaker means. The speakerphone further includes a room echo cancellation adaptive filter 56 and a trunk echo cancellation adaptive filter 66. Serially coupled within the transmit signal path is a selective suppression block 50 for suppressing a component of a Mu-Law or an A-Law quantization error signal. A second selective suppression block 52 is serially coupled within the receive signal path. Suppression of non-linearities due to Mu-Law or A-Law signal conversion is also accommodated by providing a non-linear signal processing block 40 at an input to an adaptive filter and an optional non-linear signal processing block at an output of the adaptive filter. Each of the blocks emulates and compensates for signal converter non-linearity. The speakerphone facilitates adaptive filter coefficient initialization by beginning a call in a half-duplex mode and switching to full-duplex when filter coefficients are adapted. The speakerphone also has a variable adaptation step size which is a function of a short-term estimate of signal power within the associated transmit or receive signal paths.

ABSTRACT EP 266740 A2

A telephone conversion device for converting a multiple line electromechanical telephone system having an electromechanical key system unit (KSU) for use with electronic telephones. Each conversion device includes a wall unit having a 50-pin connector for mating with the 50-pin

April 3, 2003

connector of the KSU outlet cable, and a keystrip unit positionable on the desk of the user and upon which an electronic telephone is positioned. A slender 8-wire cord extends between the keystrip and wall units. The wall unit includes a first microprocessor which operates with a line status detector for determining the operational status of five multiple telephone lines by sensing the lamp driving signals provided by the KSU. Relays under the operation of the first microprocessor connect a selected line to a common talking pair which extends within the cord between the units for connection to the telephone. A detector detects when the receiver is off-hook. The keystrip unit includes a second microprocessor which operates with a switch scanning detector to sense the operation of five momentary contact line selection switches, each corresponding to one of the lines, and a momentary contact hold switch. Five pair of line status lights are provided, one pair being positioned adjacent to each of the line selection switches and selectively emitting red or green color light. Based upon information from the detectors the microprocessors control operation of the status lights and the relays. The first microprocessor maintains a hold-queue indicating which of the lines have been put on hold by the user and the order the lines were put on hold, and can automatically select a line for connection from the hold-queue or an idle line. The light color and whether constant or flashing indicates if the line is under the user's or another's control, and whether on hold or in use.

English Abstract

A cell phone - hand set combination unit making it possible to operate a cell phone in the manner of a hand set. The unit includes a hand set provided with a mouthpiece having a microphone therein, an earpiece having a miniature loudspeaker therein, and a yoke bridging the mouthpiece and the earpiece, said yoke having a socket therein adapted to cradle a cell phone. The unit also includes a cell phone provided with a microwave transceiver to which is coupled a microphone and an ear phone; and an interface network housed in the yoke and operative when the cell phone is cradled in the socket to couple the cell phone to the hand set so that the microphone and earphone of the cell phone are supplanted by the microphone and speaker of the hand set which then functions like a cordless hand set.

French Abstract

L'invention concerne une unite de combinaison telephone cellulaire combine telephonique rendant possible le fonctionnement d'un telephone cellulaire a la maniere d'un combine telephonique. Cette unite comporte un combine telephonique pourvu d'une embouchure contenant un microphone, d'un ecouteur contenant un haut-parleur miniature, et d'un corps reliant l'embouchure a l'ecouteur, ledit corps comprenant un socle concu pour accueillir un telephone cellulaire. Cette unite comporte egalement un telephone cellulaire pourvu d'un emetteur-recepteur a micro-ondes, auquel est couple un microphone et un ecouteur ; ainsi qu'un reseau d'interface loge dans le corps, pouvant fonctionner lorsque le telephone cellulaire est accueilli dans le socle pour coupler le telephone cellulaire au combine telephonique, de sorte que le microphone et l'ecouteur du telephone cellulaire soient remplaces par le microphone et le porte-voix du combine telephonique qui fonctionne alors comme un combine sans fil.

English Abstract

In a speakerphone device identification of signals (i.e., voice input or speaker output) in a process for reducing acoustic feedback, in a communication device, is accomplished by adding a signature noise (i.e., an identification mark) to output signals radiated by the speaker to enable these signals to be separated from speech input to the microphone. Having identified the signal (i.e., speech output) likely to cause a "singing" phenomenon, appropriate insertion loss to reduce the feedback may be added to the appropriate speech path within the communication device, to reduce a probability of singing.

French Abstract

Selon l'invention, dans un dispositif de telephone haut-parleur, l'identification de signaux (entree vocale ou sortie haut-parleur) en vue de reduire la reaction acoustique, dans dispositif de communication, est realisee par l'adjonction d'un bruit signature (c'est-a-dire une marque d'identification) aux signaux de sortie emis par le haut-parleur, ce qui permet de separer ces signaux de l'entree vocale au microphone. Apres identification du signal (c'est-a-dire la sortie vocale) susceptible de produire un phenomene de resonance, une perte par insertion appropriee afin de reduire la reaction peut-etre ajoutee a la voie de conversation appropriee dans le dispositif de communication en vue de reduire la probabilite d'un phenomene de resonance.

English Abstract

A digital signal processor provides a variety of telephony services for a processor-based system. A standard **telephone** or **speakerphone** may be **coupled** to the processor-based system. Further, both ADSL and analog modem functionality, for communication with other processor-based systems, such as on a network, may be available in some embodiments. Additional graphical user interfaces may be supplied for enhanced communication of telephony services. Single or dual-line connection to the telephone network may be supported. The simultaneous operation of modem and telephony functions may also be possible in some embodiments.

French Abstract

L'invention concerne un processeur de signaux numerique fournissant une variete de services telephoniques destine a un systeme commande par processeur. Un telephone ordinaire ou un telephone a haut-parleur peut etre couple audit systeme. En outre, a la fois la fonctionnalite LNPA (ligne numerique a paire asymetrique) et modem analogique, permettant la communication avec d'autres systemes commandes par processeur, notamment en reseau, peuvent etre disponibles dans certains modes de realisation. Des interfaces d'utilisateur graphique supplementaires peuvent etre fournies de maniere a ameliorer la communication des services telephoniques. Une connexion a une ou deux lignes au reseau telephonique peut etre supportee. L'operation simultanee des fonctions modem et telephonique peuvent egalement etre possibles dans certains modes de realisation.

English Abstract

The present invention relates to apparatus for connecting wireless
telephones to a fixed wired telecommunications network. A digital
enhanced cordless telecommunications (DECT) telephone charger unit (100)
for a DECT telephone (104) is provided with a standard Private Automatic
Branch eXchange (PABX) telephone socket (110). Any conventional PABX
telephone equipment (112) can connect to the standard PABX telephone
socket (110). The DECT telephone (104) communicates with a DECT base
station (102). Also provided in the charger unit (100) is a conversion
unit (114). The conversion unit (114) interfaces between the standard
PABX telephone socket (110) and the DECT telephone (104) in order that
conventional telephone exchange facilities, including conference call
functions, **speaker phone** functions and modem **connection** functions,
can be accessed.

April 3, 2003

French Abstract

La presente invention concerne un dispositif permettant de connecter des telephones sans fil sur un reseau de telecommunication filaire fixe. Un chargeur (100) ameliore pour telephone sans fil (DECT) (104) est muni d'une prise telephonique PABX (110) standard. Tout materiel telephonique PABX (112) classique peut etre branche sur la prise telephonique PABX (110) standard. Le telephone DECT (104) communique avec une station de base DECT (102). Le chargeur (100) comporte egalement une unite de conversion (114). Cette unite (114) assure l'interface entre la prise telephonique PABX (110) standard et le telephone DECT (104). Ainsi, il est possible d'accéder a des installations d'echange telephonique classique, dont des fonctions de conference, de telephone pour orateur et de connexion modem.

English Abstract

The present invention relates to a P/C mouse and particularly to the P/C mouse both for its function and for a telephone set, in which a telephone set circuit board (20) is equipped with a mouse body (22), at the lower portion of a mouse button (10, 12) an on-hook button (24) and a dialing button (28) are mounted, and a microphone for transmission (30) and a speaker for reception (32) are mounted to the lower and upper portions of the mouse body (22), in order to use the mouse as the telephone set. The P/C mouse both for its function and for a telephone set according to the present invention enables to operate the P/C and at the same time to hold a conversation by telephone, and thus applies to the general business using the P/C, the field of communication sale, telephone number information service and the field of command communication of the police

April 3, 2003

of an army.

French Abstract

L'invention concerne une souris pour PC et particulierement une souris pour PC destinee a sa fonction premiere et servant de combine de telephone. On prevoit une carte de circuit imprime (20) logee dans un corps de souris (22). Sur la partie inferieure d'un bouton (10, 12) de souris sont installees une touche de raccrochage (24) et une touche de composition (28). Un microphone pour transmission (30) et un ecouteur de reception (32) sont montes respectivement dans les parties inferieure et superieure du corps de souris (22) de sorte que l'on puisse se servir de la souris comme d'un combine de telephone. La souris pour PC permet de faire fonctionner le PC et de maintenir a la fois une conversation telefonique. Elle trouve donc une application dans le domaine de la vente par telephone, les services de renseignements sur les numeros telefoniques et le domaine de la communication pour la police et l'armee.

English Abstract

An Internet phone provides standard voice and Internet audio functions using the familiar Plain Old Telephone System platform. Internet audio connections are initiated using an access button on the base of the telephone. A phone keypad and alphanumeric keyboard provide both DTMF dialing and Internet message handling functions. A speaker is provided or the hand set can be used to send and receive Internet compressed audio messages over the Public Switched Telephone System via the user's Internet access provider. The user selects a recipient from a stored address list or creates a new recipient using the alphanumeric keyboard.

April 3, 2003

Once the call is established, a user at either end speaks directly into the phone receiver wherein his voice signal is digitized into a voice file that is stored and transferred to the user at the other end. The Internet phone has an integrated display and display electronics which decode incoming messages. A ROM based program inside the phone decodes the address portion of an incoming Internet message and displays it on the screen identifying the identity of the caller.

French Abstract

Appareil telephonique pour Internet assurant la telephonie classique et des fonctions audio liees a Internet, sur la base de la plate-forme telephonique traditionnelle. On lance les connexions audio avec Internet par un bouton d'accès au bas du telephone. Un clavier telephonique et un clavier alphanumerique offrent a la fois la numerotation multifrequence et les fonctions de traitement de messages propres a Internet. Ledit appareil comporte un haut-parleur ou bien le combine peut etre utilise pour l'envoi et la reception des messages audio comprimes sur Internet via le reseau telephonique public commute (RTPC), en passant par le fournisseur d'accès Internet de l'utilisateur. Ce dernier choisit un destinataire dans une liste enregistree ou etablit une nouvelle adresse de destination par le biais du clavier alphanumerique. Une fois l'appel en cours, l'utilisateur a chaque bout de la ligne parle directement dans le combine, et les signaux vocaux sont numerises en un fichier vocal mis en memoire et transfere a l'utilisateur a l'autre bout. Ledit telephone possede un ecran integre et un systeme electronique d'affichage pour decoder les messages entrants. Un programme a base de memoire ROM dans l'appareil decode la partie adresse d'un message Internet entrant et l'affiche a l'ecran, ce qui permet de connaitre l'identite de l'appelant.

English Abstract

The invention relates to a broadcast receiver with an integrated telephone unit (1) which is used to switch speaker phones (20, 21, 22, 23) between broadcasting playback and telephone playback. In this connection, during **telephone** operation the **speaker phones** (20,..., 23) **connectable** to the broadcast receiver are switched to telephone playback and when a predetermined signal is received by the broadcast receiver, preferably an identification signal, modulated on a 57kHz auxiliary carrier, for traffic reports the speaker phones (20,..., 23) are partially switched to broadcasting playback. During the broadcasting reception, the **speaker phones** (20,..., 23) **connectable** to the broadcast receiver are switched to broadcasting receiver playback and when there is loop closure in the telephone unit (1) as a result of an incoming and/or outgoing call being answered, the speaker phones (20,..., 23) are switched over at least partially to telephone playback. A control circuit (5) can switch over the speaker phones (20,..., 23) and is also used for acoustic conditioning of audio signals. Different predetermined states of occupancy of the speaker phones (20,..., 23) can be selected with telephone and broadcasting signals by a user by way of a control unit (30) connected to the control circuit (5).

French Abstract

L'invention concerne un recepteur radio avec dispositif telephonique (1) integre, servant a la commutation de haut-parleurs (20, 21, 22, 23) entre la reproduction radio et la reproduction telephonique. En mode telephonie, les haut-parleurs (20,..., 23) qui peuvent etre connectes au recepteur radio sont commutes sur la reproduction telephonique et, lors de la reception d'un signal predetermine par le recepteur radio, de preference d'un signal d'identification module sur une porteuse auxiliaire de 57 kHz pour annonces relatives au trafic, les haut-parleurs (20,..., 23) sont partiellement commutes sur la reproduction radio. En mode reception radio, les haut-parleurs (20,..., 23) pouvant etre connectes au recepteur radio sont commutes sur la reproduction en reception radio et, en cas d'affectation de boucle dans le dispositif telephonique (1) en cas de reception d'un appel arrivant et/ou partant, les haut-parleurs (20,..., 23) sont au moins partiellement commutes sur la reproduction telephonique. La commutation des haut-parleurs (20,..., 23) peut se faire au moyen d'un circuit de commande (5), lequel sert en outre a la mise en forme acoustique du signal audio. Un utilisateur peut, par l'intermediaire d'une unite de commande (3) reliee au circuit de commande (5), selectionner des affectations predeterminees des haut-parleurs (20,..., 23) a des signaux telephoniques et radio.

English Abstract

The present invention is directed to an apparatus (such as a speakerphone (100)) and method for establishing a full-duplex signal path immediately upon connection of the apparatus to an external communication path (102) (such as an external telephone line). Exemplary embodiments of the present invention are directed to training the electrical echo canceler (138) with respect to the impedance of the external communication path (102) (such as an external **telephone** line to which the **speakerphone** (100) is **connected**) during an installation phase and storing the trained parameters for subsequent use prior to interfacing the system to an external telephone line and completing a full-duplex path connection.

French Abstract

L'invention concerne un appareil (tel qu'un poste a haut-parleur (100)) ainsi qu'un procede permettant d'etablir un chemin de signaux en duplex integral immediatement lorsque l'on connecte l'appareil a un circuit de communication externe (102) (tel qu'une ligne telephonique externe). Des exemples de modes de realisation de la presente invention concernent la formation du supprimeur (138) d'echo electrique par rapport a l'impedance du circuit de communication externe (102) (tel qu'une ligne telephonique externe a laquelle le poste a haut-parleur (100) est connecte) lors d'une phase d'installation et le stockage des parametres de formation en vue de les utiliser ulterieurement avant de mettre le systeme en interface sur une ligne telephonique externe et completer une connexion d'un circuit en duplex integral.

English Abstract

An electronic device (20) and method for accessing remote electronic facilities (30) and displaying associate information on a conventional television set (50). The electronic device (20) self-configures itself upon power-up or reset by initiating a data call to a configuring facility (30). Information related to available facilities and programming, autonomous mail checking is downloaded to the electronic device (20). The electronic device (20) displays a menu including several user selectable facilities. The user chooses one of the options from the menu by use of a remote keypad control (52). The options available include printing, electronic mail, news and information services. Interfacing the electronic device (20) with a stylus-type pointing device (54) permits sketching and drawing on the television (50), including superposition of images on captured television images. Captured images of graphics or text are optionally stored or forwarded to a user through a mail facility accessed through operation of the system. The captured images may subsequently be sent via facsimile transmission to other facsimile transmission machines or receivers. The electronic device (20) includes a speaker phone (136) for providing audio information received over telephones to the television (50) speaker.

French Abstract

L'invention concerne un procede et un dispositif (20) electronique permettant d'avoir acces a des unites electroniques a distance (30) et d'afficher des informations associees sur un ecran de television classique (50). Le dispositif electronique (20) s'autoconfigure lui-meme lors de la mise sous tension ou remise a l'etat initial en initiant un appel d'information vers une unite (30). Les informations relatives aux unites disponibles et a la verification de messagerie de programmation sont telechargees dans le dispositif electronique (20). Le dispositif electronique (20) affiche un menu comprenant plusieurs possibilites selectionnables par l'utilisateur. L'utilisateur choisit l'une des options du menu en utilisant une commande a clavier a distance (52). Les options disponibles comprennent l'impression, la messagerie electronique, les nouvelles et les services d'information. Une interface entre le dispositif electronique (20) et un dispositif de designation du type a stylet (54) permet de faire des croquis et de dessiner sur la television (50), et de superposer des images sur des images de television saisies. Les images saisies graphiques ou textuelles sont eventuellement stockees ou acheminees vers un utilisateur par l'intermediaire d'une unite de messagerie dont l'accès se fait par l'actionnement du systeme. Les images saisies peuvent ulterieurement etre envoyees par transmission facsimilee a d'autres telecopieurs ou recepteurs. Le dispositif electronique (20) comprend un poste telephonique a haut parleur (136) pour donner des informations sonores recues par l'intermediaire de telephones a un presentateur de television (50).

English Abstract

The present invention provides a control circuit for controlling the path of voice and data signals in a communication system which comprises at least a speaker phone (28), a cellular transmit/receive unit (TRU) (16), a cellular (CU) handset (20) and a computer (12) having at least a communications software program (68), a keyboard (64) and an I/O port (30) for communications. The control circuit receives voice and data signals from a plurality of different input sources and routes or switches the received voice and data signals to different selectable destinations. The control circuit comprises analog switching circuitry (54), a CPU (32), a modem (56), landline interface circuitry (38), TRU interface circuitry (40) and cellular handset interface circuitry (42) which are operatively connected together.

French Abstract

Cette invention concerne un circuit de commande destine a commander le chemin de signaux de voix et de donnees dans un systeme de communications, comprenant au moins un bloc microphone haut-parleur (28), une unite (16) cellulaire de transmission/reception (TRU), un combine (20) cellulaire (Cu) ainsi qu'un ordinateur (12) comportant au moins un programme (68) de logiciel de communications, un clavier (64) et une porte d'accès I/O (30) pour les communications. Le circuit de commande recoit des signaux de voix et de donnees d'une pluralite de differentes sources, et achemine ou transfere les signaux de voix et de donnees recus vers des destinations selectionnables differentes. Le circuit de commande comprend un circuit (54) de commutation analogique, un modem (56), un circuit (38) d'interface de ligne terrestre, un circuit (40) d'interface TRU ainsi qu'un circuit (42) d'interface de combine cellulaire relies de maniere fonctionnelle.

English Abstract

A telephone conversion device (10) for converting a multiple line electromechanical telephone system having an electromechanical key system unit (KSU) (18) for use with electronic telephones (21). Each conversion device includes a wall unit (12) having a 50-pin connector (6) for mating with the 50-pin connector (16) of the KSU outlet cable, and a keystrip unit positionable on the desk of the user and upon which an electronic telephone is positioned. A slender 8-wire cord (28) extends between the keystrip and wall units. The wall unit includes a first microprocessor which operates with a line status detector for determining the operational status of five multiple telephone lines by sensing the lamp driving signals provided by the KSU. Relays under the operation of the

April 3, 2003

first microprocessor (62) connect a selected line to a common talking pair which extends within the cord between the units for connection to the telephone. A detector (42) detects when the receiver is off-hook.

French Abstract

Dispositif de conversion telephonique (10) pour convertir un systeme de telephone electromecanique a ligne multiple possedant une unite de systeme a touches electromagnetiques (KSU) (18) de maniere qu'on puisse l'utiliser avec des telephones electroniques (21). Chaque dispositif de conversion comprend une unite de paroi (12) possedant un connecteur 50 broches (6) se reliant au connecteur 50 broches (16) du cable de sortie KSU, et une unite comportant une rangee de touches, que l'on peut poser sur le bureau de l'utilisateur et sur laquelle on peut poser un telephone electronique. Un mince cable a 8 conducteurs (28) s'etend entre la rangee de touches et les unites de paroi. L'unite de paroi comprend un premier microprocesseur qui fonctionne avec un detecteur d'etat de ligne pour determiner l'etat de fonctionnement de cinq lignes telephoniques multiples en detectant les signaux de commande de lampe fournies par le KSU. Des relais sous la commande du premier microprocesseur (62) relient une ligne selectionnee a une paire de conversation commune qui s'etend dans le cable entre les unites assurant la connexion avec le telephone. Un detecteur (42) detecte l'etat de decrochement du combine.

English Abstract

A telephone interface and voice recognition driven Internet browser system and method for accessing/browsing the Internet or other remote computing services on a cable or satellite television includes a phone for receiving a voice signal from a user. The voice signal controls a telephone interface, which displays Internet contents or other computing services on the television via a cable or satellite television channel/media. The system also includes a voice recognizer, preferably operated on a supercomputer or located in the phone, for recognizing/interpreting/analyzing a plurality of voice signals and generating command signals to access/browse the Internet or other computer services. The voice recognizer is capable of recognizing/interpreting/analyzing voice signals transmitted from a plurality of users in real time. The system further includes a stack of computers and an Internet browser. Each of the stack of computers is capable of accessing/browsing the Internet and retrieving/organizing requested Internet contents via the Internet browser. The requested Internet contents are sent to the user via a cable or satellite television channel/media with a frame grabber, an intelligent router, or a pre-downloaded system.

French Abstract

L'invention concerne une interface telephonique et un systeme de navigateur Internet commande par la voix et un procede d'accès a Internet et a d'autres services informatiques a distance et de navigation sur ces

ceux-ci par l'intermediaire d'une television par cable ou par satellite comprenant un telephone pour recevoir un signal vocal d'un utilisateur. Le signal vocal commande une interface telephonique, qui affiche les contenus d'Internet ou d'autres services informatiques sur le televiseur via un media/une chaine de television par cable ou par satellite. Le systeme comprend egalement un dispositif de reconnaissance vocale utilise, de preference, sur un super-ordinateur ou situe dans le telephone, afin de reconnaitre/interpreter/analyser plusieurs signaux vocaux et de generer des signaux de commande d'accès a Internet et aux autres services informatiques et de navigation sur ceux-ci. Le dispositif de reconnaissance vocale est capable de reconnaitre/interpreter/analyser des signaux vocaux transmis par plusieurs utilisateurs en temps reel. Le systeme comprend, en outre, plusieurs ordinateurs et un navigateur Internet. Chacun des ordinateurs permet d'accéder a Internet et de naviguer sur Internet ainsi que d'extraire/organiser les contenus d'Internet demandés par l'intermediaire du navigateur Internet. Les contenus d'Internet demandés sont envoyés a l'utilisateur par l'intermediaire d'un media/d'une chaine de television par cable ou par satellite au moyen d'un systeme d'acquisition d'image, d'un routeur intelligent, ou d'un systeme prealablement telecharge.

English Abstract

A portable digital electronic communication device includes an analog matrix switch to dynamically route analog signals between user interfaces and communication links. The user interfaces include various microphones, speakers, modems and other user interfaces. The communication links may include multiple telephone modules, such as cellular transceivers and telephone land-line connections, and other connections to communication devices. A processor in the communication device issues commands to the analog matrix switch to establish the desired analog signal routing between user interfaces and communication links.

French Abstract

Cette invention concerne un dispositif de communication electronique numerique et portable qui comprend un commutateur de matrice analogique permettant de router dynamiquement des signaux analogiques entre des interfaces d'utilisateurs et des liaisons de communication. Ces interfaces d'utilisateurs comprennent divers microphones, haut-parleurs, modems ou autres interfaces d'utilisateurs. Les liaisons de communication peuvent comprendre de multiples modules telephoniques tels que des emetteurs-recepteurs cellulaires, des connexions telephoniques par lignes terrestres ou d'autres connexions a des dispositifs de communication. Un processeur prevu dans le dispositif de communication va emettre des instructions vers le commutateur de matrice analogique de maniere a etablir le routage de signaux analogiques voulu entre les interfaces d'utilisateurs et les liaisons de communication.

'DESK TOP VIDEO CONFERENCING AN IMPORTANT FEATURE OF FUTURE VISUAL
COMMUNICATIONS';

ABSTRACT EP 581101 A1

A communications processor serves a group of several workstations with
audio and video transmission processing for the purpose of providing
video conferencing.

The communication processor utilizes artificial intelligence software
to read the connection. Conversion rules contained in tables so that the
system can react to the communications environment. The system is coupled
for processing optical signals for low cost communication and video
conferencing with audio and video communications within the facility area
and for long haul transmission. The communication processor provides
audio and video communications under instantaneous constraints of the
transmission medium and instantaneous degree of loading or usage.
Bandwidth, resolution and transmission rate are adjustable to fit the
constraints at the time a request for service is made. A workstation
initiates a request for service. A request for service includes data
about the nature or type of service and signal destination. This
information is sufficient for the communication processor to make several
attempts to threads before an affirmative determination can be made. If
an affirmative determination is not possible, then the communication
processor will determine which is possible and provide an output to the
user for possible changes in a request. (see image in original document)

English Abstract

A system (100) to control and monitor telephony devices (140, 160) that do not digitally interface with a control device (110), such as a PC, is disclosed. The control device (110) communicates with the telephony device (140) typically via a standard telephone cable (154) using tones to convey status and control information.

French Abstract

L'invention concerne un systeme permettant de commander et de surveiller des dispositifs telephoniques ne faisant pas interface de facon numerique avec un dispositif de commande tel qu'un ordinateur personnel.

Generalement, le dispositif de commande communique avec le dispositif telephonique au moyen d'un cable telephonique de type classique faisant appel a des tonalites pour acheminer des informations d'etat et de commande.

English Abstract

A remote transaction system which may be used to conduct business transactions wherein visual contact between a buyer and a seller is desired or required. A transaction booth (11) is located remotely from an operations center (10), the booth and the center being connected by audio and video communication lines (12-13). The booth (11) includes audio and video equipment for transmitting and receiving audio and video signals between the booth and the center. Decoders (20-24) are provided in the booth to receive telephone touch tones or pulses from the operations center and to control the audio and video equipment and other equipment in the booth. Alternatively, a programmable device, such as a controller or microcomputer, generates control signals for controlling the equipment. A dispenser unit is controllable from the operations center utilizing a decoder (24) to selectively dispense items or objects to a customer. A payment module (21) facilitates payment for items or services

April 3, 2003

by cash, credit card, or other appropriate means. The various equipment included in the booth is assembled onto modules which can be simply and easily installed in the booth and interconnected using a wiring harness, facilitating the assembly and maintenance of the system.

French Abstract

Le systeme de transaction a distance decrit permet d'effectuer des transactions commerciales dans lesquelles un contact visuel entre un acheteur et un vendeur est souhaite ou requis. Une cabine de transaction (11) est placee a distance d'un centre d'operations (10), la cabine et le centre etant relies par des lignes de communication audio et video (12-13). La cabine (11) comprend un equipement audio et video pour transmettre et recevoir des signaux audio et video entre la cabine et le centre. Des decodeurs (20-24) sont installes dans la cabine pour recevoir des tonalites ou impulsions telephoniques du centre d'operations et pour commander l'equipement audio et video et autre equipement se trouvant dans la cabine. Dans une variante, un dispositif programmable tel qu'un controleur ou micro-ordinateur produit des signaux de commande pour commander l'equipement. Une unite de distribution peut etre commandee depuis le centre d'operations en utilisant un decodeur (24) pour distribuer selectivement des articles ou objets vers un client. Un module de paiement (21) facilite le paiement des articles ou services en payant en argent comptant, par carte de credit ou autres moyens appropries. Les differents equipements montes dans la cabine sont assembles en modules qui peuvent etre installes aisement dans la cabine et relies entre eux en utilisant un harnais de cablage pour faciliter l'assemblage et l'entretien du systeme.

ABSTRACT EP 330384 A2

In order to perform voice-switched telephoning, a hands-free telephone includes a speaker, a microphone, a receive variable attenuator (R-ATT), a transmit variable attenuator (T-ATT), a receive signal detector, a transmit signal detector and an attenuation control circuit. The telephone also includes an auxiliary control circuit which prevents the output of the transmit signal detector from reaching the attenuation control circuit during a transient period between a call origination and the beginning of conversation. During the transient period, only the speaker is enabled to output a ringback tone therethrough. When the output level of the transmit signal detector exceeds a predetermined level, the auxiliary control circuit passes the output of the transmit signal detector to the attenuation control circuit to start the voice-switched telephoning. Once the auxiliary control circuit passes the output of the transmit signal detector, it holds this state until the conversation finishes.

ABSTRACT EP 310876 A2

A radio arrangement and method allows a portable (210) and a mobile (212) to uniquely communicate on a radio system having at least one remote system site (114). The portable (210) has at least one information set (such as the radio's identification information and repertory dialing information) (356 or 360), and the mobile (212) is intercoupled therewith via a connector (214). The connector is used for transferring a code, which designates the information set, from the portable (210) to the mobile (212), whereby the mobile (212) adopts the information set of the portable (210) for subsequent communication. The arrangement offers an user having a portable, with its limited features and functions, to utilize all of the capabilities of the mobile.

...SPECIFICATION have failed to emulate some of the more important mobile characteristics including power output rating, **speaker phone**, diversity and speech **recognition** /synthesis capabilities.

Previously, a **portable could be coupled** to a **mobile** mounted apparatus which would provide a large source of primary power, an improved antenna location...the portable 210 to utilize circuitry features which are inherent to the mobile 212 such as transceiver characteristics (eg., transmitter power, receiver sensitivity, antenna characteristics, and, when available, **speaker phone functions**, diversity, and speech synthesis and voice **recognition** capabilities).

Fig. 3 illustrates details of the **connector** 214, the portable 210 and the mobile 212. The connector includes only eight electrical connections ...the u-C 336. The transceiver 366 is disabled in response to the u-C 336 detecting the availability and selection of the more powerful mobile transceiver 338. The **detection** is accomplished by the u-c 336 monitoring the 9.5V **connection** 324 through a line conditioner circuit 374. The line conditioner 374 may be implemented using...Although the V/SP 380 is shown communicating with the u-C via an independent **connection**, the data transfer bus (318, 320 and 322) may alternatively be employed.

The **mobile** 's voice- **speaker phone** operation is utilized by entering a special key code into the portable's keypad 350...

Fulltext Word Count: 5855

English Abstract

A pool of echo cancellers (126) provides echo cancellation on PCM digital transmissions on an as needed basis. A dynamic port device (110) operating under the direction of call processing (134) identifies the transmissions requiring echo cancellation and routes the identified transmissions through echo cancellers. The echo cancellation can be performed on an as needed basis without having to dedicate an echo canceller to each DSO channel. The dynamic port device (110) can provide multiplexing up to SONET (114) carrier levels immediately following selective echo cancellation.

French Abstract

Un ensemble d'annuleurs d'echo (126) assure l'annulation de l'echo sur des transmissions numeriques MIC (modulation par impulsions et codage) lorsque cela s'avere necessaire. Un dispositif (110) a points de connexions dynamiques fonctionnant sous la direction d'un traitement (134) d'appel identifie les transmissions necessitant une annulation de l'echo et envoie les transmissions identifiees dans les annuleurs d'echo. L'annulation de l'echo peut etre effectuee selon les besoins sans qu'il soit necessaire de consacrer un annuleur d'echo a chaque canal DSO. Le dispositif (110) a points de connexion dynamiques assure le multiplexage jusqu'aux niveaux de porteuse du reseau optique synchrone (SONET) juste apres l'annulation selective de l'echo.

English Abstract

A channel bank speech synthesizer for reconstructing speech from externally-generated acoustic feature information without using externally-generated voicing or pitch information. An N-channel pitch-excited channel bank synthesizer (340) is provided having a first low-frequency group of channel gain values (1 to M) and a second high-frequency group of channel gain values (M+1 to N). The first group control a first group of amplitude modulators (950) excited by a periodic pitch pulse source (920), and the second group controls amplitude modulators excited by a noise source (930). Both groups of modulated excitation signals are applied to the bandpass filters (960) to reconstruct the speech channels, and then combined at the summation network (970) to form a reconstructed synthesized speech signal. Additionally, the pitch pulse source (920) varies the pitch pulse period such that the pitch pulse rate decreases over the length of the word.

French Abstract

Un synthetiseur de parole ayant une serie de canaux permet de reconstruire la parole a partir d'informations caracteristiques acoustiques generees de l'exterieur sans utiliser d'informations vocales ni relatives a la hauteur du son generees de l'exterieur. Un synthetiseur (340) ayant une serie de canaux excites par la hauteur des sons de N canaux possede un premier groupe de faible frequence de valeurs de gain de canaux (1 a M) et un second groupe de haute frequence de valeurs de gain de canaux (M + 1) a N). Le premier groupe commande un premier groupe de modulateurs d'amplitude (950) excites par une source d'impulsions de hauteur de son periodique, et le second groupe commande des modulateurs d'amplitude excites par une source de bruit (930). Les deux groupes de signaux d'excitation modules sont appliques a des filtres a bande passante (960) pour reconstruire les panneaux de parole, puis ils sont combines au niveau d'un reseau de sommation (970) pour former un signal de parole reconstruit et synthetise. De plus, la source d'impulsions de hauteur de son (920) fait varier la periode des impulsions de hauteur des

April 3, 2003

sons de sorte que la cadence d'impulsion des hauteurs de son décroît sur la longueur du mot.

English Abstract

A user-interactive control system for an electronic device which synthesizes speech from speech recognition templates to generate voice reply feedback to the user indicative of which template word was recognized. The acoustic features of the user-spoken speech are extracted by the acoustic processor (110) and applied to the training processor (170) to generate word recognition templates stored in the template memory (160). Recognition processor (120) compares the user-spoken features to the recognition templates to provide voice command data for the device controller (130) which controls the operating parameters of the electronic device (150). The device controller also produces device status data for the synthesis processor (140) which synthesizes a speech reply signal from the word recognition templates. In the preferred embodiment, a hands-free user-interactive control system for a mobile radiotelephone is provided utilizing speech synthesis from speech recognition templates.

French Abstract

Un systeme de commande interactif pour un dispositif electronique synthetise la parole a partir de modeles de reconnaissance de la parole pour generer une reaction de reponse vocale a l'utilisateur indiquant quel mot modele a ete reconnu. Les caracteristiques acoustiques de la

April 3, 2003

parole de l'utilisateur sont extraites par le processeur acoustique (110) et appliquees au processeur de formation (170) pour produire des modeles de reconnaissance de mots stockes dans la memoire de modeles (160). Le processeur de reconnaissance (120) compare les caracteristiques vocales de l'utilisateur avec les modeles de reconnaissance pour fournir des donnees de commande vocale au controleur (130) qui commande les parametres de fonctionnement du dispositif electronique (150). Le controleur du dispositif produit egalement des donnees d'etat du dispositif pour le processeur de synthese (140) qui synthetise un signal de reponse vocale a partir des modeles de reconnaissance de mot. Dans le mode preferentiel de realisation, un systeme de commande interactif laissant les mains libres pour un radiotelephone mobile utilisant la synthese de la parole a partir de modeles de reconnaissance de la parole est decrit.

English Abstract

Arrangement and method for processing speech information in a speech recognition system. In such a system where the speech information is depicted as words, each word representing a sequence of frames and where the recognition system has means for comparing present input speech to a word template, the word template stored in template memory (160) and derived from one or more previous input word, the present invention is best employed. The invention describes combining (322) contiguous acoustically similar frames derived from the previous input word or words into representative frames to form a corresponding reduced word template,

April 3, 2003

storing the reduced word template in template memory (160) in an efficient manner, and comparing (326) frames of the present input speech to the representative frames of the reduced word template according to the number of frames combined in the representative frames of the reduced word template. In doing so, a measure of similarity between the present input speech and the word template is generated.

French Abstract

Sont decrits un agencement et une methode de traitement d'informations vocales dans un systeme de reconnaissance de la parole. Dans un tel systeme ou les informations vocales sont decrites comme des mots, chaque mot representant une sequence de blocs, et ou le systeme de reconnaissance possede des moyens pour comparer les entrees vocales a un modele de mot, le modele de mot etant stocke dans une memoire de modele (160) et etant derive d'un ou de plusieurs mots d'entree anterieurs, la presente invention s'applique au mieux. L'invention decrit la combinaison (322) de blocs contigus acoustiquement semblables et derives du ou des mots d'entree anterieurs en blocs representatifs pour former un modele de mot correspondant reduit, le stockage du modele de mot reduit dans la memoire de modele (160) de maniere efficace, et la comparaison (326) des blocs de l'entree vocale actuelle avec les blocs representatifs du modele de mot reduit selon le nombre des blocs combines dans les blocs representatifs du modele de mot reduit. De cette maniere, on obtient une mesure de la similitude entre l'entree vocale et le modele de mot.

English Abstract

A method and arrangement for reducing a sequence of initial frames into a reduced set of representative frames by combining the initial frames

April 3, 2003

(510) into a plurality of representative frames (514), the combining process including generating a distortion measure (D1-D5) associated with each representative frame (514) and comparing each distortion measure to a distortion threshold. From these representative frames, a set of mutually exclusive frames is determined to minimize the number of representative frames, whereby each representative frame in the set represents a unique set of contiguous initial frames and has an associated distortion measure which does not exceed the distortion threshold.

French Abstract

Methode et agencement de reduction d'une sequence de blocs initiaux en un ensemble reduit de blocs representatifs en combinant les blocs initiaux (510) en une pluralite de blocs representatifs (514), le procede combinatoire consistant a generer une mesure de distorsion (D1-D5) associee a chaque bloc representatif (514) et a comparer chaque mesure de distorsion a un seuil de distorsion. A partir de ces blocs representatifs, un ensemble de blocs mutuellement exclusifs est determine pour reduire au minimum le nombre de blocs representatifs, de sorte que chaque bloc representatif dans l'ensemble represente un ensemble unique de blocs initiaux contigus et possede une mesure de distorsion associee qui ne depasse pas le seuil de distorsion.

English Abstract

An improved hands-free user-interactive control and dialing system for use with a speech communications device. The control system (400) includes a dynamic noise suppressor (410), a speech recognizer (420) for implementing voice-control, a device controller (430) responsive to the speech recognizer for controlling operating parameters of the speech communications device (450) and for producing status information representing the operating status of the device, and a speech synthesizer (440) for providing reply information to the user as to the speech communications device operating status. In a mobile radiotelephone application, the spectral subtraction noise suppressor (414) is configured to improve the performance of the speech recognizer (424), the voice quality of the transmitted audio (417), and the audio switching operation of the vehicular speakerphone (460). The combination of noise processing, speech recognition, and speech synthesis provides a substantial improvement to prior art control systems.

French Abstract

Un systeme (400) de commande et d'appel interactif utilise avec un dispositif de communications vocales comprend un eliminateur dynamique de bruits (410), un dispositif de reconnaissance de la parole (420) pour effectuer la commande vocale, une commande (430) du dispositif sensible au dispositif de reconnaissance de la parole pour commander les parametres operationnels du dispositif de communications vocales (450) et pour produire des informations representant l'etat operationnel du dispositif, et un synthetiseur de parole (440) pour fournir des reponses a l'utilisateur concernant l'etat operationnel du dispositif de communication vocale. Dans une application en tant que radiotelephone mobile, l'eliminateur de bruit (414) par soustraction spectrale ameliore la performance du dispositif de reconnaissance de la parole (424), la qualite vocale du signal audio transmis (417) et l'operation de commutation audio de telephones a haut-parleur (460) utilises dans des vehicules. La combinaison de traitement des bruits, de reconnaissance et de synthese de la parole apporte des ameliorations considerables aux systemes de commande de l'art anterieur.

English Abstract

Speakerphones for both radio and landline telephones. The prior art speakerphones are unable to accommodate high ambient noise environments and allow one party to break in relatively easily on the other party. The invention has: first and second variable gain amplifiers (202, 212) for amplifying signals incoming from the microphone and signals incoming to the loudspeaker, respectively, in response to a gain control signal; first and second detectors (205, 207), each having a noise level detector (242), and a gain adjuster (208), for varying the sensitivity of the detectors in response to a detector control signal; and control circuitry (230, 240) responsive to the detectors for generating the gain control signal and the detector control signal. The gains of the first and second amplifiers are varied in opposite directions and the sensitivities of the first and second detectors are varied in opposite directions, allowing for improved hands-free voice communication in high ambient noise environments.

French Abstract

Les haut-parleurs anterieurs ne peuvent s'adapter a des environnements bruyants et permettent a un des interlocuteurs d'interrompre relativement facilement l'autre interlocuteur. La presente invention comprend un premier et un second amplificateur a gain variable (202, 211) destines a amplifier les signaux provenant du microphone et les signaux destines aux haut-parleurs respectivement, en reponse a un signal de commande de gain. La presente invention comprend egalement un premier et second detecteur (205, 207) muni chacun d'un detecteur de niveau de bruit (242) et un dispositif de reglage du gain (208) destine a faire varier la sensibilite des detecteurs en reponse a un signal de commande des detecteurs. La presente invention comprend en outre des circuits de commande (230, 240) repondant aux detecteurs afin de produire le signal de commande du gain et le signal de commande des detecteurs. Les gains du premier et du second amplificateur et les sensibilites du premier et du second detecteur varient dans les directions opposees, permettant de meilleures communications verbales les mains libres, dans des environnements bruyants.

Detailed Description

Detailed Description

... circuitry 106, is switchably coupled to mobile radio 112 by switch 110. Switch 110 selectively couples a transmit signal and a receive signal from mobile radio 112 to either speakerphone 120 or mobile telephone 108.
In landline applications, the improved speakerphone 130 of the present invention can likewise be.
